the flexible chair for use during
conferences or presentations.

Axia Pro,
for intensive VDU work
and protracted sitting.

Axia highlights

1 The AXIA supports the pelvic region instead of the lumbar region.

2 To prevent sliding out of the chair: backward tilting of the seat is at the height of the ischia, where 80% of the bodyweight is absorbed.

3 The chair's tilting point is situated at about one-third from the front of the seat. When tilted, the front of the seat stays horizontal. As a result, the feet are not lifted off the floor when tilted backwards and the upper legs are not pinched at the back.

4 The angle between the seat and back can be adjusted to the unique 'Bracing Principle' and remains the same when the chair is tilted.

5 The armrests do not move when the chair is tilted and always meet up with the edge of the desk. The height is adjustable up to 30cm and the width can also be adjusted, making them sufficiently supportive both for people with narrow and broad shoulders.

6 AXIA's gas-spring mechanism is adjustable according to body weight and feels stable. As the chair is tilted further backwards, the counter pressure is increased and vice versa.

7 Control levers, including seat slide, are found on both sides, and exactly where they might be expected. Other adjustments relating to the size of a person, such as back rest height and weight resistance, are within the central axis of the chair.

8 The seat and back pads can be replaced or removed by means of the 'Click-On Click-Off' system.
